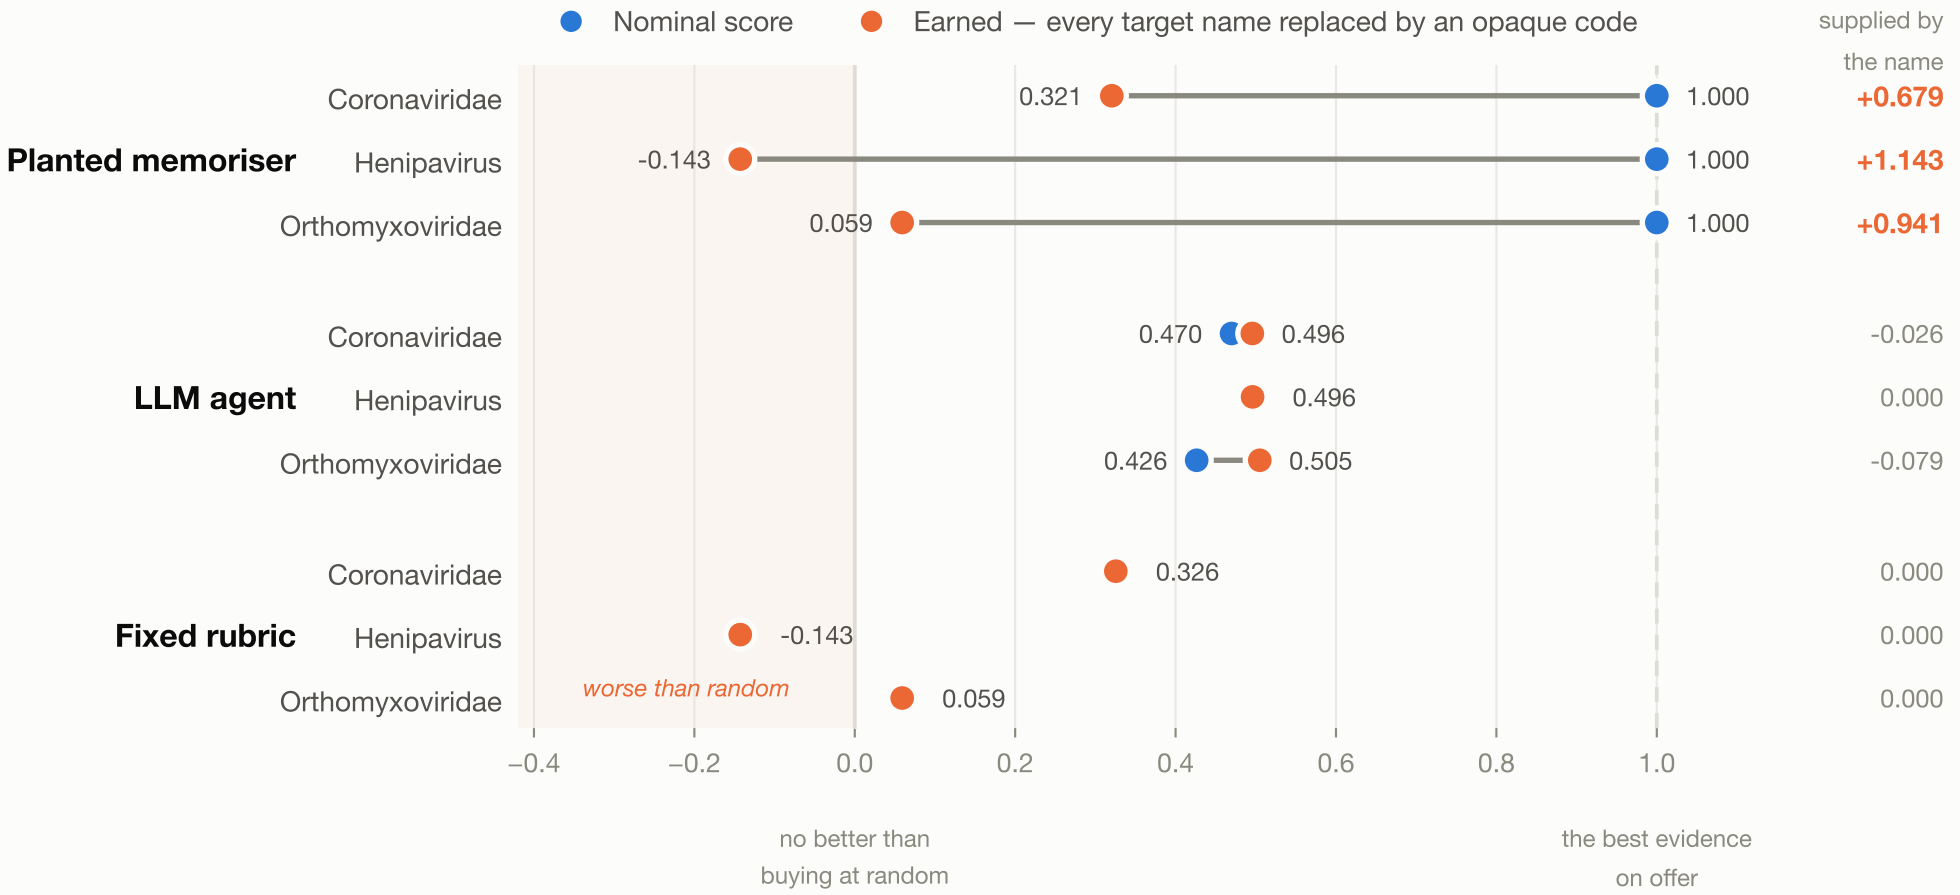
A perfect score the orbit removes entirely

Each turn the co-scientist spends one action buying a piece of evidence, and the score is how good that purchase was.

Only the hard cases count: states where the most useful evidence concerns a target that is not currently in the lead, so digging into the favourite cannot score.

The planted memoriser buys perfectly on every packet — until the targets are renamed, when it drops to no better than random, or worse.



Identity orbit, 2 elements per cell, read against a null orbit of 2 re-runs; basis is null + identity throughout, because the recorded runs do not share a transform set. Single host (WilliamsMBP236).

The bound is lexical: a claim scrubbed of every name can still identify its subject, so this measures what the name spells out and not what the biology gives away.
